STUDY AREA

Bandon, West Cork, is a growing regional town with a population of 8,196 (Census 2022), located approximately 30 km southwest of Cork City. Its role as both a commuter town and gateway to West Cork makes public transport accessibility an important consideration for residents and visitors.

KEY MESSAGE

Network walking time provides the primary measure of pedestrian accessibility in the analytical framework, while footpaths, crossings and other pedestrian-network features provide contextual evidence about the physical conditions along those routes. These features may affect the practicality and safety of individual access journeys but are not independently scored or incorporated into the Composite Accessibility Index. Locations where network accessibility and pedestrian infrastructure conditions appear inconsistent should therefore be considered for site-level investigation.
